Description

I've been using this cyber power UPS and I just recently upgraded to a Xeon processor server set up from the AMD-FX8350 setup i was on. The UPS was working great, still does actually just weird messages. The low battery that i reported earlier happened when plex was analyzing the library I guess the slight bump in power or something cause it. After i turn that off it would only say low battery if it was streaming something very HD. But ever since this new set up its different error which is why i am reporting it. It kept saying out of date driver after which it would connect and disconnect. Last night i received 75 emails saying NOCOMM before that was BADCOMM. Its not really a problem but the emails are annoying so i am going to turn off the service for a bit. But it kept talking about the driver for 2+ days. Unsure if that's it.
