Description

Touch screen does not work for my Toshiba dynabookN51 with 10.3Release.

The PC-BSD handbook says

2.2.2. Touch Screens

PC-BSD® should automatically detect USB-based touch screen devices. If your display is USB and is not auto-detected, send the output of `usbconfig` and your `/etc/X11/xorg.conf` file using the Report a bug tool.

but I think this instruction is inappropriate because setting for touch screen driver(synaptics driver) is done in `/usr/local/share/X11/xorg.conf.d/50-synaptics.conf`, so the `/etc/X11/xorg.conf` is irrelevant. Instead I attach here `/var/log/Xorg.0.log` and `/var/log/messages` along with the output of `usbconfig`. IMHO, the real problem is that a device for the touch screen is not created. This may be a genuine FreeBSD10.3 problem, not a PC-BSD problem, but anyway I want to know a bugfix or a workaround for this.

Also, I hope the above instruction in the PC-BSD handbook will be rewritten.
