This is still not fixed. The problem is worse now that it immediately exits when trying to select an interface. Will attach credentials for ipmi for reproduction shortly.

To reproduce:

Press option 1 to create a link aggregation.
Press option 2 to use lACP
Press option 1 to select igb0

You will see FreeBSD/amd64 as if the script exited, and Console setup will reappear as shown in the screenshot.

After selecting option 2 to configure link aggregation you can see that the link aggregation was never created at all.
